

- Grader SK 225

for tractors with 3-point hitch cat. II,
80-150 HP

Completely hydraulically controlled

For road building and maintenance, leveling, landscaping, back-filling, scarifying, smoothing and snow removal.

The POMA-Grader SK 225 is a most modern, very strongly built piece of equipment for all kinds of grading jobs for contractors, forestry and communities.

Adjustments are made with electrohydraulic-valves. Joy-stick-levers inside the tractor cabin help to handle the unit highly comfortable.

The offsetting of the grader to the right or left prevents the tractor being taken out of its track and also allows working close up to walls and ditches. The support wheels set wide to the rear always run in the track of the grader blade.

It is also possible with the blade in backward position to grade while travelling forward, thus removing any unevenness. For turning and transportation the grader is lifted through the tractor three-point hitch.

More than two thousand customers in Europe have proven the POMA-land and roadgrader satisfactorily. The unique design is made to the highest German engineering standards and practices. The finish is yellow painted and highly resistant. This machine will last for many years of hard work.
